
PERFORMANCE AND RESULTS MANAGEMENT SYSTEM (PRMS)

W3/Bilateral Reporting User Guide

A practical, step-by-step guide to reporting a W3/Bilateral result manually in the Reporting Tool, covering the journey from finding your project to the AI quality check and Submit for review.

Version 1, 21 September 2026 · U.S. English

Before you start

PRMS's bilateral module is where Center reporters submit results funded through Window 3 or a bilateral partnership — its own area of the Reporting Tool, with its own workspace, project catalog, result creator, and result editor, separate from the module that handles pooled/core (W1/W2) reporting. This guide walks a **Result submitter** — Center staff who report bilateral results — through the manual reporting path end to end: opening the Center workspace, finding your project, starting a result through the setup drawer, choosing how you want to report it, completing the manual form, and working through the result editor from Save draft to the AI quality check and Submit for review. It closes by explaining when the AI-Assisted path is the better choice instead.

Every section pairs its narrative with a screenshot from the running Reporting Tool. Wherever you see an orange ring around a control, that ring marks the element the section is describing; where the ring carries a small labeled chip, the chip names that element directly. Both markers are added only for this guide and never appear in the application itself.

To begin, sign in to PRMS with your CGIAR account at <https://reporting.cgiar.org>. The guide is meant to be read in order — each section builds on the one before it, so working through it once mirrors working through an actual submission.

Throughout this guide, an **orange ring or arrow** like this one marks the one action each screenshot is calling out — it is never part of the app's own interface.

The Bilateral Workspace

Opening a Center from the bilateral module lands you on its workspace. Across the top sits the **Center identity band**: the Center's acronym as the page heading, its full name underneath, and an information button that opens a short popover describing the Center and the tab you are currently on.

Directly below the identity band, a row of **four tabs** — **Overview**, **Reporting**, **Results**, and **AI Draft Results** — switches between the Center's whole view of its bilateral work. **Overview** summarizes the Center's reporting progress with a deck of KPI cards. **Reporting** is the working tab: it opens the project catalog, covered next, where you find a project and start a result. **Results** lists the Center's bilateral results, submitted and still in progress, with filters — including by reporting phase — to narrow the list. **AI Draft Results** lists results an AI process has drafted from supporting evidence, as cards you review before deciding whether to carry one into an official submission.

The tabs stay in place as you move between them, so you can check overall progress on Overview, jump into Reporting to start or continue a result, and come back to check Results or AI Draft Results without losing your place in the Center.

The Center identity band sits above the Overview, Reporting, Results, and AI Draft Results tabs.

/bilateral/Bioversity%20%28Alliance%29/home

Finding Your Project

The **Reporting** tab opens onto the project catalog: the list of bilateral projects the Center can report results against. A search box lets you look a project up by code, title, or program, and a row of quick filter chips narrows the list to one Science Program at a time.

Above the catalog, a strip of KPI cards doubles as a filter: a **Total Projects** card, one card per top Science Program, and – when the Center has projects mapped to more than one Program – a **Multi-Program** card for co-mapped projects. Clicking any of these cards filters the catalog below to match it; the **Total Projects** card, the **All** chip, or – when no projects match – **Reset Filters** clears it. A view switcher lets you display the catalog as a grid of cards or as a dense table; the table trades the card view's "Active" status indicator for a more compact row.

Each **project card** carries the project's code, an "Active" status indicator, a badge showing how many results have already been reported against it, the project's title and summary, and – when the project contributes to more than one Science Program – a Science Program Alignment box listing each Program with its percentage allocation. A single-Program project shows that one Program at 100%. The card's footer offers two actions: **View results**, which opens the project's already-reported results in the Results tab, and **Create result**, which opens the setup drawer for a new result on that project – clicking anywhere else on the card does the same thing as **Create result**. That drawer is covered next.

Start reporting a result for this project

Click Create result on the project card to start reporting a new bilateral result for it.

/bilateral/Bioversity%20Alliance%29/home

Starting a Result

Clicking **Create result** on a project card — or the card itself — opens the **Set up bilateral result** drawer on the right side of the screen, with the project's code and title shown at the top so you always know which project you are reporting against.

If the project contributes to more than one Science Program, the drawer's first step asks you to **select a Primary Science Program**: pick the one Program this result is primarily reported against from a list of radio options, each showing the Program's code, name, and its allocation percentage on the project. A project mapped to only one Science Program skips this step entirely and treats that single Program as primary.

Once a primary Program is set, and if the project has other Science Programs mapped to it, an optional **Contributing Science Programs** list appears below: a set of checkboxes for any additional Programs or Accelerators that also contribute to this result. Selecting contributing Programs is not required to continue — only the primary selection is.

With the Science Program step settled, the drawer moves to its next step: choosing how you want to report the result, covered next.

Step 1 of the setup drawer – choose the Primary Science Program this result is reported against.

/bilateral/Bioversity%20Alliance%29/home

Choosing How to Report

With a primary Science Program set, the drawer's second step asks you to choose how you would like to create and report your bilateral result in PRMS. Two cards present the choice side by side.

AI-Assisted is described as a way to reuse information without duplicating effort: it lets you leverage existing result information, uploaded documents, or previously reported data, and uses intelligent recommendations to accelerate creating the result. **Complete the Form Manually** is described as creating a bilateral result step by step by manually completing the reporting form. Picking **AI-Assisted** replaces the drawer's contents with a document-upload panel in place of the form; picking **Complete the Form Manually** opens the form described next.

Until a primary Science Program is selected in the previous step, both cards stay disabled and selecting either one returns you to that step instead. This guide documents the manual path, so from here it follows **Complete the Form Manually** through the form and the editor. The AI-Assisted path — and where its output later shows up, in the AI Draft Results tab — is covered later in this guide.

Choose how you would like to create and report your bilateral result in PRMS.

AI-Assisted
Reuse Information Without Duplicating Effort
Leverage existing result information, uploaded documents, or previously reported data to accelerate bilateral result creation using intelligent recommendations.

Complete the Form Manually
Create a bilateral result step by step by manually completing the reporting form.

This is the decision point – this guide follows the manual path from here

Step 2 of the setup drawer – this guide follows the Complete the Form Manually path from here.

/bilateral/Bioversity%20%28Alliance%29/home

The Manual Form

The manual form asks for a handful of things in order, revealing each next step only once the one before it is answered.

First, **Select Result Level: Outcome** ("Long-term changes resulting from the research") or **Output** ("Products, services or capacities delivered"). Choosing a level reveals the **Result Type** dropdown, scoped to that level. Outcome offers Policy Change, Innovation Use, and Other Outcome; Output offers Capacity Sharing for Development, Knowledge Product, Innovation Development, and Other Output – seven result types in total.

If you choose **Knowledge Product**, a repository section appears with two tabs: **Browse repositories**, which lets you pick an existing item from a repository – once picked, the item shows as selected (with a **Change item** option to pick a different one) and its title fills the result's title field – and **Manual entry**, where you paste a repository link or handle and click **Sync** to validate it.

Once a result type is chosen, the **Result title** field appears – it does not exist on the form before that point. As you type, a word gauge next to the label counts your words against a limit of 30, and turns to indicate you are over it. At the same time, the form checks your title against existing results in the background and shows one of a few states beneath it: that the check is still running, that an identical title already exists and must be changed before you can create the result, that the check itself failed and should be retried, or that no exact match was found and you can proceed. If PRMS finds titles that are similar but not identical, it lists them underneath as well, for you to review before continuing.

Filling in the level, type, title, and – for a Knowledge Product – its repository handle is what the form needs before the result can be created and the editor opens, covered next.

Choosing a Result Level reveals the Result Type dropdown, scoped to that level.

The Editor at a Glance

Creating the result opens the result editor: a two-column layout with a **sections rail** on the left and the scrolling form, with its own footer, on the right. Although Overview heads the rail's list, the editor does not open there — it opens on **General information** instead.

The rail lists the result's sections in order: Overview, General information, Contributors & partners, Geographic location, and Evidence, plus, for most result types, Type-specific details — that last one does not appear at all for an Other Outcome or Other Output result. Each item in the rail shows whether it still has unsaved edits, is complete, or is still pending. Above the list, once a result is loaded, the rail also shows the result's code, type, and status; below the list, a progress bar and a label reading "**N of M sections complete**" track how many of the tracked sections are done.

At the bottom of the content column, a footer stays in place as you scroll. Its left side holds **Back** and **Next** buttons to step between sections, next to a position indicator reading "Section X of Y" for the section currently open — a different count from the rail's "sections complete" progress, since this one tracks where you are, not how much is done. Its right side shows the open section's own save state and a **Save draft** button; what those states mean is covered in the next part of this guide.

Clicking **Overview** in the section rail — it is not where the editor opens, so you have to click it — opens a dashboard that summarizes the W3/Bilateral project this result is linked to, next to the result's own identity: its code, type, and reporting phase, and its funding source. The project's Lead Center, its summary, and its description are all shown read-only here.

While the result is still open to editing, two fields on this same dashboard are not read-only:

Project and **Program** — the Primary Science Program — can both be changed here, and a **Save project and program** button appears once you have picked a different one, to persist the change. This is the only place in the editor where the project and Primary Science Program can be changed; the Contributors & partners section, covered later in this guide, shows the Primary Science Program read-only.

To the left of every section sits the **section rail**, the column that lists the result's sections in order and that you use to move between them. Above the list it carries a link back to where you came from and the result's own identity — its code, its type, and a status badge; below the list, and once this result already has an AI quality assessment on file, a short quality summary appears there too — before the progress bar and its "N of M sections complete" label, which in turn sits above the **Submit for review** button covered later in this guide.

L-AGR003 – L-AGR003-“Strengthening system linkages for harmonized digit

PROGRAM

Scaling for Impact

PROJECT SUMMARY

Not provided in W3 Registry

PROJECT DESCRIPTION

This project seeks to strengthen linkages among digital systems, data platforms, and institutional actors to improve coordination, data sharing, and decision-making within agricultural and livestock sectors. The project is being implemented to address fragmented information systems and improve the use of digital technologies for development outcomes. Through system integration, stakeholder engagement, and capacity strengthening, it promotes harmonized approaches to data management and service delivery. Beneficiaries include government agencies, development partners, researchers, and producers who rely on timely and reliable information. Expected outcomes include improved interoperability of systems, stronger institutional coordination, and enhanced evidence-based planning and monitoring

Overview – a read-only summary of the linked project; Project and Program are the two fields you can still change here.

/bilateral/Bioversity%20%28Alliance%29/result/31002?phase=8

General Information

This is where the editor actually opens — **General information**, not Overview. It carries the result's core minimum-data fields: a required **Title of Result**, capped at 30 words and tracked by a word gauge as you type; a required **Description of Result**, capped at 300 words; and a required lead contact person for the result. Below these, a **Complete full metadata** toggle reveals additional, optional fields — including Impact Area Scores — for reporters who want to record more than the minimum standard asks for.

In this and every other field-carrying section (Contributors & partners, Geographic location, Evidence, and Type-specific details), an AI quality-check flag can appear once an assessment exists — here, next to the title and next to the section as a whole — pointing at whichever field the check found something to say about, together with the AI's own comment on it.

Contributors & Partners

Contributors & partners records who else is behind this result. The **Primary contributing science program** and **Lead center** are shown read-only, assigned automatically from the project's own mapping — you cannot change them from here. Below them, three optional pickers let you add more contributors: **Contributing science programs**, listing every Science Program other than the primary one — not only the ones already mapped to the project, unlike the Contributing Science Programs step in the setup drawer; **Contributing CGIAR centers**; and **Contributing W3/bilateral projects**, which lists every other bilateral project you can link this result to.

The one required control in this section is **External partners**: either check **This result has no external partners**, or select at least one partner from the picker that appears when that box is unchecked — the section needs one or the other to be complete.

W3/Bilateral Reporting User Guide · Version 1, 21 September 2026

Geographic Location

Geographic location opens with a required choice: **What is the geographic focus of the result?**, answered with one of five radio options – Global, Regional, Country, Sub-national, or "This is yet to be determined." Choosing **Global** or "**This is yet to be determined**" asks nothing further.

Choosing **Regional** opens the required **Select regions** multi-select directly, and also asks a separate yes/no question – whether there are countries you wish to specify for the result – which, if you answer yes, opens the required **Select countries** multi-select as well. Choosing **Country** or **Sub-national** skips straight to the required **Select countries** multi-select, with no yes/no question on either axis; for **Sub-national**, once you have selected at least one country, a further picker appears for each country selected, asking you to specify at least one sub-national location within it.

For some result types, a further question asks whether the result may also have potential impact in other geographic areas. Answering yes opens a second geographic-focus choice for that additional scope – the same options as above, minus "This is yet to be determined," so four rather than five. None of these four asks a yes/no follow-up: Regional opens its own required regions multi-select directly, Country or Sub-national opens its own required countries multi-select directly, and Sub-national again adds its own per-country picker once at least one country is selected.

The screenshot displays the 'Geographic location' section of a reporting form. The sidebar on the left contains navigation links: 'Overview', 'General information', 'Contributors & partners', 'Geographic location', 'Evidence', and 'Type-specific details'. The main content area is titled 'Strengthening system linkages for harmonized digit - Test - 09212026'. A section titled 'Geographic location' is highlighted with an orange border. It contains a required question: 'What is the geographic focus of the result?'. Below the question are five radio button options: 'Global', 'Regional', 'Country', 'Sub-national', and 'This is yet to be determined'. The interface also shows a 'Back' button, a 'Next' button, and a 'Draft up to date' button.

Geographic location – the geographic-focus choice determines which further fields appear.

/bilateral/Biodiversity%20Alliance%29/result/31002?phase=8

Evidence requires at least one entry with a valid link before the section is complete – that requirement is stated on screen, and the section stays flagged until it is met. **Add evidence** opens a form for one entry at a time: a **Source of the evidence**, then either a **Link** (the part the section actually requires) or, if you choose to upload instead, whether the evidence can be shared publicly followed by the file itself, and finally an optional description. Each entry you add appears as its own card, with its own edit and delete controls, up to a limit of 6 evidence entries per result; once you reach that limit, **Add evidence** disappears and the section shows "Maximum of 6 evidence items reached."

Type-Specific Details

Type-specific details carries the fields that only apply to the result's own type — a badge at the top of the section names that type, and the fields beneath it change with it: Policy Change, Innovation Use, Capacity Sharing for Development, Knowledge Product, and Innovation Development each show their own set of questions.

This section **does not appear at all** for an Other Outcome (type 4) or an Other Output (type 8) result — not as an empty section, but missing from the rail entirely, because those two types have no type-specific fields to collect. Every other result type keeps this as its sixth and last rail section.

Save draft

Type-specific details – the fields shown change with the result's own type; absent for Other Outcome and Other Output.

/bilateral/Bioversity%20%28Alliance%29/result/31002?phase=8

Saving Your Work

The footer at the bottom of the editor stays in place as you scroll and holds two groups of controls. On the left, **Back** and **Next** step you between sections, next to a **position indicator** reading "Section X of Y" for the section you currently have open — a plain count of where you are, separate from the rail's own "N of M sections complete" progress bar, which counts how much of the form is actually done.

On the right, the footer shows the open section's own save state — **Unsaved changes**, **Section complete**, a pill reading "N fields missing" (or "N fields to fix" once some of those fields are filled in but invalid), or **Draft up to date** — next to the **Save draft** button. Clicking the "fields missing/to fix" pill opens a small panel naming each one, with a **Go** link that jumps to and briefly highlights the field when it can be found uniquely on screen.

Save draft saves whatever is filled in, even if the section is incomplete — it does not require every required field first. Save it once and the footer's message updates to say what, if anything, is still missing or still needs fixing; a failed save shows the server's own reason for the failure, not a generic error.

The AI Quality Check and Submit for Review

Submit for review, on the section rail, stays disabled until every tracked section reports complete, no request from this flow is already in progress, and the result is still open to editing by your Center. Beneath the button, a short **submit note** reads "The AI quality check runs first" — hovering or clicking it opens the fuller explanation: clicking Submit for review checks the result's metadata for QA conformity first, and you can still adjust the data to address any comments before the result actually reaches the Program for review.

Clicking **Submit for review** does not submit the result by itself. If any section still has unsaved changes, or a field is filled in but over its word limit, you are told which and asked to fix it first; otherwise, the click starts the AI quality check and a window opens over the editor while it runs, explaining what each verdict color means — green (meets the quality criteria), amber (acceptable, but not the best version), red (does not meet the criteria), and grey (not evaluated, nothing to assess). Once the check finishes, the same window shows an overall verdict alongside a per-section breakdown — each with its own color, and, where the AI has feedback, a way to open it or to jump straight to the section it concerns — plus a note for each piece of evidence the check looked at.

From there, the window's footer offers **Make adjustments**, which closes it and returns you to editing. Alongside it, as long as the verdict you are looking at still matches your latest edits, sits a second button — labeled **Submit for review**, or **Submit without quality check** if the service could not complete the assessment — and that is the one action that actually moves the result out of Editing and into Pending review. If you have changed the result since a stored assessment ran, that second button is not offered: the window tells you the check predates your latest edits and only lets you close it, so you run the check again before you can submit.

If a result already carries an assessment from an earlier check, this same rail carries a short summary of it above Submit for review, so you do not have to rerun the check just to see its last verdict — reopening the full window from there reads the stored result rather than requesting a new one, and is subject to the same up-to-date requirement before it will let you submit.

The AI-Assisted Path and AI Draft Results

Choosing **AI-Assisted** in the setup drawer does not open a form at all — as covered earlier in this guide, it replaces the drawer with a document-upload panel instead. From there you attach the documents, previously reported data, or other supporting evidence you already have, and PRMS processes them in the background: a status panel checks progress periodically, and you do not have to keep it open while it works — a persistent chip in the Center header shows a job is still running and how long it has been running, so you can leave and come back.

When processing finishes, the panel confirms a draft is ready, tells you to review it in **AI Draft Results** and promote the ones you want to report, and offers a **Go to Draft Results** button; the draft itself is marked as generated with AI assistance from your sources, to be reviewed and edited before submitting. The same **AI Draft Results** tab in the Center header opens the same list directly.

AI Draft Results — also called **My Drafts** from inside a draft's own screen — lists every draft an upload has produced for the Center, each carrying the fields the AI extracted from your documents, next to two actions: **Create Result** and **Discard**. Clicking **Create Result** opens a dialog summarizing the draft's Science Program, project, type, and Center, and its own Create Result button stays disabled until you tick a required confirmation — *"I confirm that my Center has reviewed and validated this AI-generated draft and its source evidence"* — this is not a plain yes/no, it is an attestation about your Center's own review. Confirming turns the draft into a real bilateral result, pre-filled with the extracted data, and opens it in the same result editor this guide has already walked through — from there it is the same Save draft, AI quality check, and Submit for review already covered. **Discard** asks a simpler confirmation and permanently deletes the draft and everything extracted with it; it does not ask for any attestation, only that you mean to delete — and it cannot be undone.

When to prefer each. Complete the Form Manually is the direct path this guide has documented end to end: you enter every field yourself, with nothing to review or correct afterward. AI-Assisted is worth choosing instead when you already have documents or previously reported data to draw from and would rather review and correct an extracted draft than type each field by hand. Either way, once a result exists — typed by hand or promoted from a draft — it is the same editor, the same sections, and the same path to Submit for review.

The AI Draft Results (My Drafts) tab lists AI-generated drafts awaiting your review.

`/bilateral/Bioversity%20Alliance%29/drafts`

Result Statuses

The result editor's identity strip, at the top of the section rail, carries a small status badge next to the result's code and type. Only four values render there: **Editing** — while the result is still open for you to work on; **Pending review** — once Submit for review, covered earlier in this guide, has moved it out of your hands; **Approved**; and **Rejected**. A result in any other state shows no badge at all in this identity strip — the header only recognizes these four.

These same four values are also everything a result you create and submit yourself, through the manual path this guide documents, will ever carry. It starts in Editing, moves to Pending review the moment Submit for review succeeds, and from there the Science Program's own review settles it as either Approved or Rejected — it never passes through any other state along the way.

The **Results** tab, described earlier in this guide, lists every bilateral result recorded against the Center — not only the ones a reporter created and submitted through this manual path — and its Status filter and Status column carry three further values beyond the editor's four: **In QA**, **Submitted**, and **Discontinued**. Those apply to results that reach the system another way — for example, ones submitted through the platform's ingestion API rather than typed by hand, or ones an administrator has discontinued — and you may see them while browsing that list. A result you create and submit through the manual form and editor this guide describes does not pass through any of the three.

The screenshot shows the PRIMS Reporting interface. On the left is a sidebar with 'MY SCIENCE PROGRAMS' and 'MY COIAR CENTERS'. The main area displays the 'Results' tab for 'Bioversity (Alliance)'. A callout box says 'You are on the Results tab'. Below the tabs, there's a search bar and filter options. A table shows results with columns: CODE, SOURCE, TITLE, PROCESSING, RESULT TYPE, ROLE, and STATUS. A callout box points to the STATUS column, saying 'Filter results and track each one's review status'. The table shows one result with CODE '31082', SOURCE 'W3', and STATUS 'Editing'.

CODE	SOURCE	TITLE	PROCESSING	RESULT TYPE	ROLE	STATUS
31082	W3	Strengthening system linkages for har...	L-AGRO03~Strengthening sy	Strengthening system linkages for harri	Capacity sharing for devel	Contributing

The Results tab lets you filter results and track each one's review status.

```
/bilateral/Bioversity%20%28Alliance%29/results?source=w3&method=manual
```

W3/Bilateral

Results funded bilaterally or through Window 3, reported through the Reporting Tool's own bilateral module rather than the W1/W2 Initiative flow. The module's query contract tags every result with a `source` of `w3` (bilateral) or `w1w2`.

Source: PRMS (not on CLARISA) – bilateral-query-params.ts SOURCE_VALUES – accessed on 2026-09-21

Science Program

The Reporting Tool's on-screen label for a Program (see Program) – the two terms refer to the same entity.

Source: PRMS (not on CLARISA) – reused from the archived W1/W2 guide's glossary – accessed on 2026-09-15

Primary Science Program

The one Science Program a bilateral result is principally reported against. Chosen in the setup drawer's first step from the Science Programs mapped to the result's project (a single-Program project skips the choice and its one Program is primary); shown read-only, alongside the Lead Center, in the editor's Contributors & partners section, and changeable afterward only from the Overview section's Project and Program fields.

Source: PRMS (not on CLARISA) – this guide's own sections 4, 8, 10; bilateral-query-params.ts role values – accessed on 2026-09-21

Contributing Science Program

A Science Program or Accelerator that also contributes to a bilateral result without being its primary one. Offered as an optional checklist in the setup drawer, scoped to the Programs already mapped to the project; the editor's Contributors & partners section offers a separate, broader picker listing every Science Program other than the primary one, not only the ones mapped to the project.

Source: PRMS (not on CLARISA) – this guide's own sections 4 and 10 – accessed on 2026-09-21

Outcome

Long-term changes resulting from the research. One of the two result levels a bilateral result can be reported at; choosing it in the manual form scopes the Result Type dropdown to Policy Change, Innovation Use, and Other Outcome.

Source: PRMS (not on CLARISA) – result-types-by-level.ts RESULT_LEVEL_LABELS, id 3; this guide's own section 6 – accessed on 2026-09-21

Output

Products, services or capacities delivered. The other result level a bilateral result can be reported at; choosing it in the manual form scopes the Result Type dropdown to Capacity Sharing for Development, Knowledge Product, Innovation Development, and Other Output.

Source: PRMS (not on CLARISA) – result-types-by-level.ts RESULT_LEVEL_LABELS, id 4; this guide's own section 6 – accessed on 2026-09-21

Result type (W3/Bilateral)

The bilateral manual form offers seven result types: three under Outcome – Policy Change (id 1), Innovation Use (id 2), Other Outcome (id 4) – and four under Output – Capacity Sharing for Development (id 5), Knowledge Product (id 6), Innovation Development (id 7), Other Output (id 8). The ids run from 1 to 8, but id 3 is not assigned to any bilateral result type, which is why the count is seven rather than one type per id.

Source: PRMS (not on CLARISA) – result-types-by-level.ts RESULT_TYPES_BY_LEVEL – accessed on 2026-09-21

Policy change

Policies, strategies, legal instruments, programs, budgets, or investments at different scales (local to global) that have been modified in design or implementation, with evidence that the change was informed by CGIAR research.

Source: [CLARISA glossary](#) – accessed on 2026-09-21

Innovation use

A metric used to assess the extent to which an innovation is already being used, by which type of users and under which conditions, with a scale ranging from no use (lowest level - 0) to common use (highest level - 9). An innovation that is only used by the project, design or intervention team or its direct partners will score low in innovation use. Innovations that are commonly used by anticipated end-users will score high in innovation use. Users that are directly incentivized by a project or intervention to use an innovation are considered project team or direct partners which will score as low innovation use. (Scaling Readiness/ IPSR-term: www.scalingreadiness.org).

Source: [CLARISA glossary](#) – accessed on 2026-09-21

Other Outcome

The bilateral form's catch-all Outcome type (id 4) for results that are not a Policy Change or an Innovation Use. Unlike every other result type, it has no Type-specific details section on the editor rail – that section is absent entirely for a result of this type.

Source: PRMS (not on CLARISA) – result-types-by-level.ts id 4; this guide's own section 13 – accessed on 2026-09-21

Capacity sharing for development

Activities that develop the know-how and capacity to design, test, validate and use innovations. Examples: training-of-trainers programs at the farmer level; providing guidance on RBM and MEL; training programs with public and private sector partners; educating PhD and MSc students; ongoing institutional support to national partners, particularly NARES; and strengthening government policy analysis.

Source: [CLARISA glossary](#) – accessed on 2026-09-21

Knowledge product

Knowledge products are intellectual assets generated from research and development activities such as articles, briefs, reports, extension and training content, databases, software, and multimedia elements that contribute to behavioral changes in particular actors.

Source: [CLARISA glossary](#) – accessed on 2026-09-21

Innovation development

The process of developing innovations from an idea to a proven product, technology, service or arrangement that is validated for its ability to contribute to positive impacts when used at scale. The process often includes basic research, innovation design, and improving innovations based on testing under (semi-)controlled and uncontrolled conditions. Progress in innovation development is measured in an evidence-based way along the 0-9 levels of innovation readiness. (Scaling Readiness/ IPSR-term: www.scalingreadiness.org).

Source: [CLARISA glossary](#) – accessed on 2026-09-21

Other Output

The bilateral form's catch-all Output type (id 8) for results that are not Capacity Sharing for Development, a Knowledge Product, or Innovation Development. Like Other Outcome, it has no Type-specific details section on the editor rail.

Source: PRMS (not on CLARISA) – `result-types-by-level.ts id 8`; this guide's own section 13 – accessed on 2026-09-21

MDS (Minimum Data Standard)

The per-section completeness tracker that drives the editor's rail checks, its "N of M sections complete" progress bar, and the footer's "N fields missing"/"N fields to fix" state. Overview is not tracked by it, which is why it never gets a completion ring in the rail.

Source: PRMS (not on CLARISA) – `bilateral-result-creator.component.ts MDS-tracker comments`; this guide's own sections 7 and 14 – accessed on 2026-09-21

Knowledge Product handle

The repository identifier for a Knowledge Product result – either picked from Browse repositories or pasted as a link/handle under Manual entry and validated with Sync. For a browsed item, the manual form stores whichever of the item's `hdl.handle.net` link, its own item URL, or its bare handle is set, preferring the `hdl.handle.net` link and falling back in that order; for a manually entered one, it stores exactly the link or handle you typed and synced.

Source: PRMS (not on CLARISA) – `bilateral-manual-create-form.component.ts (kpHandle, handleUrl)`; this guide's own section 6 – accessed on 2026-09-21

AI draft

A candidate bilateral result the AI-Assisted path extracts from uploaded documents or prior data, held in the AI Draft Results (My Drafts) list until you either promote it – creating a real, editable bilateral result pre-filled with the extracted fields – or discard it, which permanently deletes it.

Source: PRMS (not on CLARISA) – `my-draft-results.component.ts, bilateral-ai-draft-detail.component.ts/.html`; this guide's own section 16 – accessed on 2026-09-21

Editing

The status a bilateral result is created in and stays in while its reporter is still working on it. The editor's identity-strip badge shows it for `status_id 1`; Submit for review is what moves a result out of it.

Source: PRMS (not on CLARISA) – `bilateral-page-header.component.ts STATUS_BADGES`; this guide's own section 17 – accessed on 2026-09-21

Pending review

The status a manually-created result moves to the moment Submit for review succeeds — out of its reporter's hands and into the Science Program's review queue. The editor's identity-strip badge shows it for status_id 5.

Source: PRMS (not on CLARISA) — bilateral-page-header.component.ts STATUS_BADGES; this guide's own sections 15 and 17 — accessed on 2026-09-21

Approved

The status a Pending review result reaches once the Science Program's review accepts it. The editor's identity-strip badge shows it for status_id 6.

Source: PRMS (not on CLARISA) — bilateral-page-header.component.ts STATUS_BADGES; this guide's own section 17 — accessed on 2026-09-21

Rejected

The status a Pending review result reaches if the Science Program's review does not accept it, along with a justification the reporter can read back from the Results tab. The editor's identity-strip badge shows it for status_id 7.

Source: PRMS (not on CLARISA) — bilateral-page-header.component.ts STATUS_BADGES; bilateral-results-list.component.ts openJustification/REJECTED_STATUS_ID; this guide's own section 17 — accessed on 2026-09-21

Result status (Results tab)

Beyond the editor's four reporter-facing values (Editing, Pending review, Approved, Rejected), the Results tab's Status filter and column carry three further values for results that reach the system another way, not through this guide's manual path: In QA, Submitted, and Discontinued.

Source: PRMS (not on CLARISA) — bilateral-results-list.component.ts STATUS_KEY_LABELS, bilateral-query-params.ts STATUS_KEY_TO_ID; this guide's own section 17 — accessed on 2026-09-21
